WHITEPAPER · FIG 0 · BUSINESS MODEL

Rooms make data. Makers pay for it.

Contributors' sensors produce raw indoor-air readings. The hub turns them into de-identified metadata that appliance makers buy outright or subscribe to by API.

DATA PROVIDER

Data contributors

- Homes · offices · commercial spaces
- Indoor-air (IAQ) IoT sensors installed
- Rewards by contribution

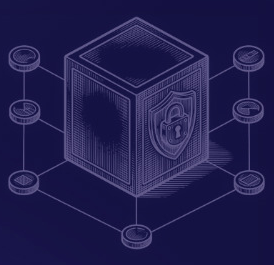

Supply real-time environmental data and earn rewards by contribution. Outdoor (OAQ) sensors for rooftops, roadsides and schools are the next line.

BUILT ON Credentials → XLS-20 license NFT

↓ Raw readings ↑ Contribution rewards

PLATFORM HUB

Platform hub

- On-chain integrity for raw data
- Personal data de-identified
- Metadata processing · quality scoring
- XRPL + cloud infrastructure

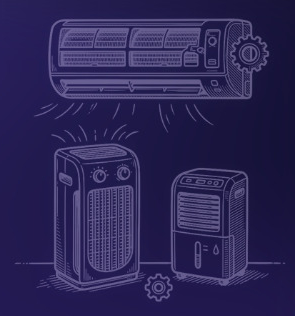

Stores raw data tamper-free, de-identifies it, then turns it into metadata manufacturers can use.

BUILT ON Integrity → oracle batch Merkle root · De-identification → 5-step pipeline

↓ Refined metadata ↑ Data fees Revenue

DATA CONSUMER

Appliance makers

- Air conditioners · dehumidifiers · air purifiers
- Ventilation · smart-home platforms
- Purchase or subscription API

Buy refined data or subscribe by API, for R&D and marketing.

BUILT ON Billing → x402 data products

Rewards are spent back on appliance discounts and filter subscriptions, so the value stays inside the ecosystem.

Data flow · · · · Value flow
